

PAVE EDGE Advantage

STRUCTURE / SHAPE: The reinforced, triangular, hollow core shape provides the best possible rigidity, structural support and tie-in to the pavement system

MATERIAL: PAVE EDGE is made from Poly Vinyl Chloride (PVC) a structural plastic product.

FROST HEAVE / SAND RETENTION LIP: The lip is designed to be placed under the paver and sand. The entire edging lays directly on the base. This prevents sand migration from under the pavers and reinforces stability.

SECTION TO SECTION CONNECTION: PAVE EDGE provides the best section to section connection in the industry. Our tube connectors allow continuous strength along the edging without any weakness at the joints.

TWO TYPES - No Compromise! PAVE EDGE is available in two products, because of quality.

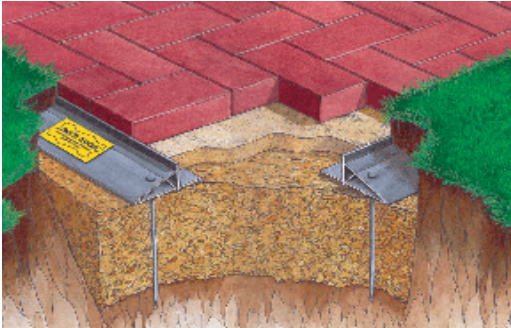

RIGID - The original PAVE EDGE. Designed to match the durability of the pavers. PAVE EDGE will maintain the perimeter interlock better than any other product. Designed for straight areas, but flexible enough to support gradual curves. For smaller curves PAVE EDGE RIGID can be easily cut.

FLEXIBLE: PAVE EDGE FLEXIBLE combines the durability and design of PAVE EDGE RIGID with flexibility to produce tighter and shorter curves. Easily connected to PAVE EDGE RIGID, the two combine to do every job possible!

PAVE EDGE RIGID and **FLEX** have predrilled holes. Less spikes are needed with PAVE EDGE than with any other edging out there. The durability and performance of PAVE EDGE out performs the competition.

CLEANERS

Cleaning, prior to sealing, is the first step towards beautiful pavers. Virtually maintenance free, pavers sometimes need a little attention to remove dirt and stains. PAVE CHEM offers the best 'job' tested solutions on the market today. Our hands-on experience is your gain when it comes to the right way to protect and preserve your new or existing paver installation.

Efflorescence Cleaner

PAVERPREP is a concentrated cleaner containing a special blend of acids and detergent that was developed specifically for concrete pavers, clay pavers and retaining wall surfaces. PAVERPREP is highly effective remove efflorescence. Efflorescence is the chalky white look that develops on many pavers from naturally occurring salts in the raw materials pavers are made from. Before sealing or when you desire to refresh the original color, a simple cleaning with PAVERPREP will remove a finite layer off the surface and after a good rinse, you will see a uniformity of color that surpasses the surface's appearance even when it was new. Using PAVERPREP prior to sealing will allow for maximum sealer adhesion and durability. PAVERPREP has proven to be effective, economic and easy to use. Most surfaces are easily cleaned without scrubbing.

Rust and Severe Stain Cleaner

PAVER DE-STAINER is very strong acid cleaner developed as a preparatory step to the overall cleaning with PAVERPREP. It removes non-petroleum stains such as rust, fertilizer and other difficult to remove stains.

Degreaser, Stain and Spot Remover

A combination of detergents and mild acid formulated to attack the hard to remove stains caused by oil, grease, vegetation and soil. Everyone who takes pride in their pavers should have a bottle on hand to clean spills before they become stains and have the peace of mind knowing there is a product that works effectively when stains do occur.
